

Premium Vinyl Fencing™

*Choose Premium Vinyl Fencing™  
for your high quality vinyl fence.*

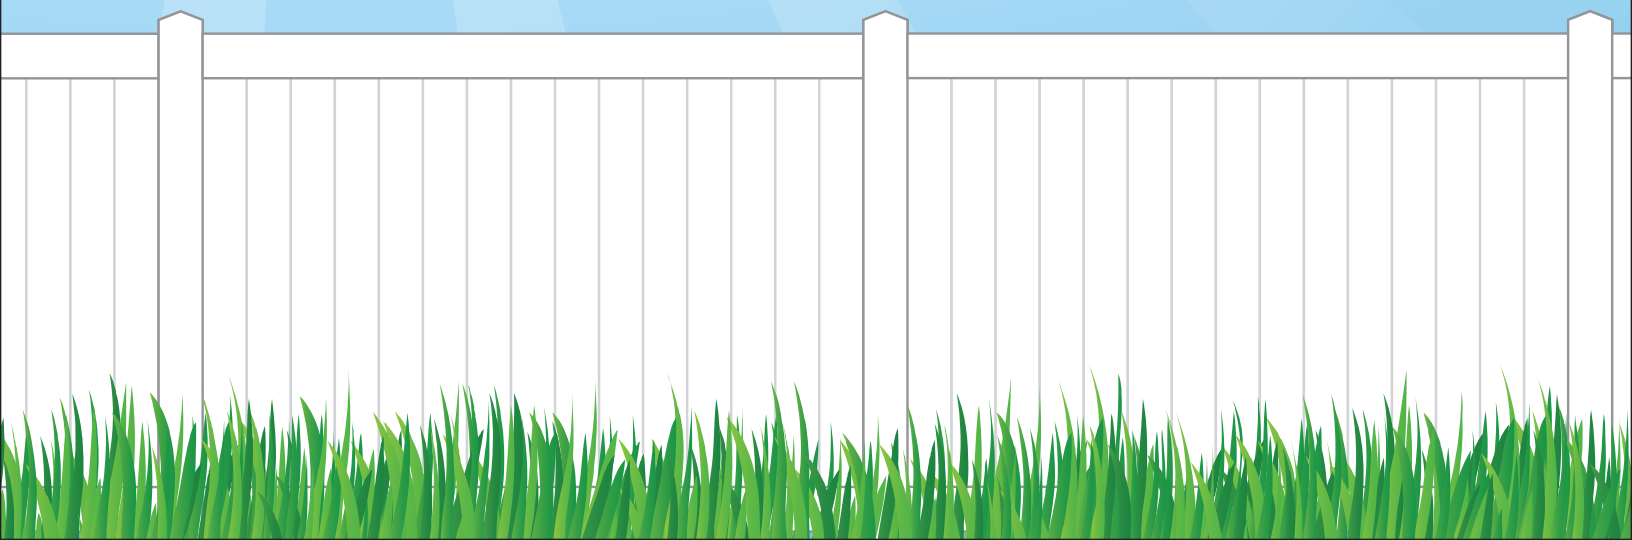

**Premium Vinyl Fencing** has many upgraded features to offer you a solid product that will look as good as new for years to come. We only use virgin vinyl material that is lead free. Premium Vinyl Fence products also meet and exceed standards for rigid PVC exterior profiles used for fencing and railings.

#### **Warranty.**

Premium Vinyl Fencing is backed by a Limited Lifetime Warranty for residential application and 30 years when used on commercial sites. Our Warranty is fully transferable.

#### **Necessary Additives.**

We use essential additives needed to keep your fence looking beautiful. These include UV inhibitors, impact modifiers and non-chalking titanium dioxide (min. 10 parts/100). These are "expensive" additives and not always used in more economical vinyl products. We use both mono-extruded and ASA co-extruded to offer the best fencing for our customers. All of our colours and woodgrain fencing use the ASA co-extruded vinyl to provide the best fade protection available. Our white profile are made using mono-extrusion. Our mission at Direct Fencing Supply is to offer our customer a fence they can be proud of for years to come.

DFS TOP RAIL TIE

## Bigger Components.

DFS components are bigger and stronger than the competition. Our top and bottom rail are a true 2x6 on our most popular privacy fence. The pickets are also 7/8" thick loaded with internal ribs for strength. We supply 2 3/8" steel posts, as opposed to 1 7/8", for post and collar method installations.

## Internal Reinforcements.

Our fences contain industry-leading reinforcements to ensure resistance to the inevitable forces and impacts it will face. For added stability and strength, our Picket Lock System features a hook and lock connecting method, rather than standard tongue and groove. Internal ribs add strength and the bottom rails have an I-beam insert to prevent sagging. Aluminum gate I-beams are used inside of a PVC post to hang your gate. The rails and posts of the gates also contain metal reinforcements.

## Top Rail Tie.

Instead of the traditional keeper screw, we use a Top Rail Tie to connect the top rail to the post. This distributes the "pull" of the rail over a larger surface area. It is a key component of our solid fence system. It also provides a cleaner, more professional looking installation.
